

TRAP LIKE A PRO

Professional exterminators use the Integrated Pest Management (or IPM) approach to catch rats and mice. Follow these steps to identify and solve your pest problem.

STEP 1

Inspect your home for entry points and food sources. If food is plentiful, breeding will occur. Inspect all cupboards and stored pet food in and around the home.

STEP 2

Use JAWZ™ Rat and Mouse Traps in all areas where you see any droppings, including nearby areas where they may be hiding. **Cabinets, behind furniture, near household entry points, sides of garage doors, in attics and crawl spaces or basements** are all likely areas. TIP: Place every 6' to better your chances.

STEP 3

Place JAWZ® Glue Traps where rats or mice may run, such as: **along walls, sides of refrigerator and stove, behind washers and dryers** etc.

Tip: Place every 6' to better your chances.

STEP 4

Seal all holes around pipes and wires leading into the structure. Repair all damaged vents, and install tight fitting door sweeps on entry door and garage doors. A mouse can enter a building through a 1/4 inch diameter hole and a rat through a hole 1/2 inch in diameter.
